

In pregnancy, infections are a key cause of anemia and can be prevented by sleeping under a bednet and taking intermittent preventive treatment (IPTp) for malaria and deworming pills.

Anamia can be prevented

Pcross the lifespo

In pregnancy, anemia can be prevented by taking iron folic acid (IFA) supplements.

In 2011, 54% of pregnant women in Cameroon consumed 90 or more **IFA** tablets

Not enough women are taking IPTp to prevent malaria during pregnancy (26%, 2011)

of infants in Cameroon are exclusively breastfed during the first six months after birth (2011)

In 2011, 61% of children 6-23 months of age consumed foods rich in iron*

One out of four (26%) married adolescent girls expressed an unmet

need for family planning (2011)

*Includes meat (including organ meat), fish, poultry, and eggs

For infants, young children, and mothers, delayed cord clamping, sleeping under a bednet, exclusive breastfeeding, and birth spacing reduce the risk of becoming anemic.

healthy growth.

For young children, continued breastfeeding and adequate complementary feeding (including micronutrients), preventing and treating malaria, and taking deworming pills can prevent anemia and promote

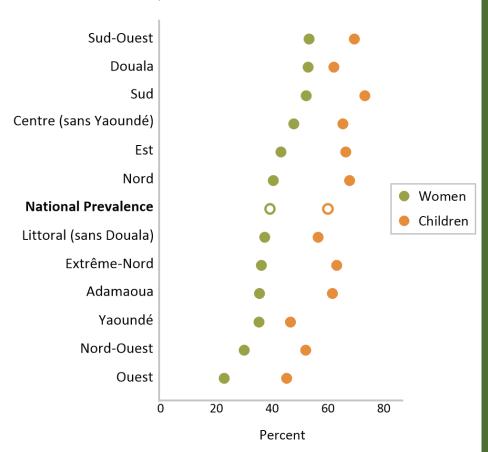

In adolescence, IFA supplements and deworming pills help prevent anemia. Family planning delays the age at first birth.

A multisectoral approach to prevent anemia will save lives and improve the wellbeing of mothers, infants, and children

Anemia has substantial negative effects on the health and economic wellbeing of nations and communities. Children with anemia experience irrevocable cognitive and developmental delays and exhibit decreased worker productivity as adults. Globally, maternal anemia increases the risk of pre-term delivery and low birth weight, and iron-deficiency anemia underlies 115,000 maternal deaths and 591,000 perinatal deaths each year.²

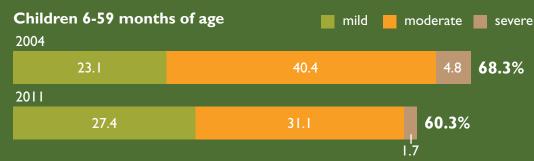

Prevalence of anemia among children 6-59 months and women 15-49 years, by region

Source: Cameroon DHS, 2011

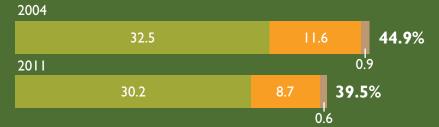

I. Walker, S. P., T. D. Wachs, J. M. Gardner, B. Lozoff, G. A. Wasserman, E. Pollitt, and J. A. Carter. 2007. "Child development: risk factors for adverse outcomes in developing countries." Lancet, 369(9556): 145-157.

Trends in the prevalence of anemia in Cameroon

The DHS hemoglobin levels used to diagnose anemia in children 6-59 months in grams/dL are: Mild 10.0-10.9; Moderate 7.0-9.9; Severe <7.0; Any <11.0.

Women 15-49 years of age

The DHS hemoglobin levels used to diagnose anemia in non-pregnant women 15-49 years of age in grams/dL are: Mild 10.0-11.9; Moderate 7.0-9.9; Severe <7.0; Any <12.0.

Status of Policies or Strategies to Support Reductions in Anemia*

- ☑ IFA for pregnant women ➤ Long-lasting insecticidal nets (LLINs) for household use ▼ IFA for women of reproductive age ✓ Indoor residual spraying ☑ IFA for adolescent girls ✓ National policy on sanitation ✓ Iron and/or folic acid fortification ☑ IPTp for pregnant women legislation Malaria diagnosis and treatment ➤ Delayed cord clamping Dietary diversity for complementary ■ Deworming for children ➤ Deworming for pregnant women ☑ Breastfeeding
- ☑ policy in place missing documentation

policy pending

■ no policy

In Comparative Quantification of Health Risks: Global and Regional Burden of Disease Attributable to Selected Major Risk Factors. M. Ezzati, A. D. Lopez, A. Rodgers, and C. J. L. Murray, eds. Geneva: World Health Organization.

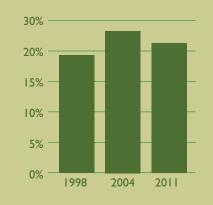

Anemia is a Preventable Condition—Simple Interventions Can Have a Huge Impact

Increase iron uptake and stores

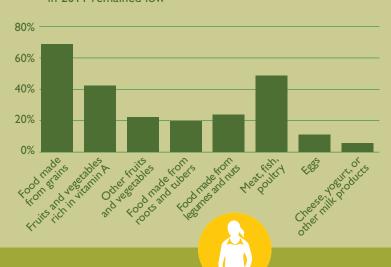

IFA supplementation among pregnant women increased from 2004 to 2011

Contraception use moderately increased among married women from 1998 to 2011

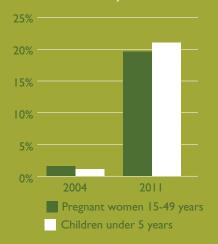

Diverse food consumption among children 6-23 months in 2011 remained low

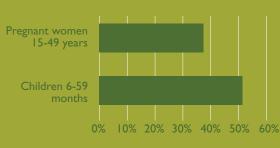

Reduce iron losses and infection

Insecticide-treated mosquito net (ITN) use increased dramatically from 2004 to 2011*

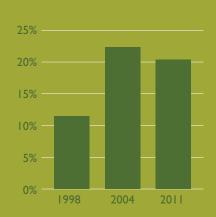

*Percentage who slept under an ITN the night before the survey

Not enough children and women received deworming medication in 2011*

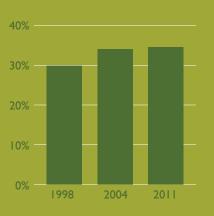

*Deworming medication given in past 6 months for children and during last pregnancy for women

Exclusive breastfeeding of children <6 months has fallen from 2004 levels

The percentage of households with an improved latrine/toilet has plateued*

*Definition of 'improved latrine/toilet' has changed slightly across years. See Demographic and Health Surveys

Multiple Sectors Play a Role in Anemia Prevention and Treatment

Stunting and anemia share similar risk factors and are responsive to many of the same interventions

Agriculture

- Increase income and reduce poverty
- Production of biofortified and iron-rich crops
 - Small livestock/poultry
 - Dietary diversity

Health

- Iron supplementation
 - Deworming
- Breastfeeding and complimentary feeding
 - Family planning
- Malaria prevention and treatment
- Delayed cord clamping

Water and Sanitation

- Improved latrines
 - Handwashing
- Access to clean water
- Livestock management
 - Infectious disease prevention
