

In pregnancy, anemia can be prevented by taking iron folic acid (IFA) supplements.

Scross the lifesp

Anemia

For infants, young children, and mothers, delayed cord clamping, sleeping under a bednet, exclusive breastfeeding, and birth spacing reduce the risk of becoming anemic.

For young children, continued breastfeeding and adequate complementary feeding (including micronutrients), preventing and treating malaria, and taking deworming pills can prevent anemia and promote healthy growth.

In adolescence, IFA supplements and deworming pills help prevent anemia. Family planning delays the age at first birth. In 2011-2012, 43% of pregnant women in Congo consumed 90 or more IFA tablets

Not enough women are taking IPTp to prevent malaria during pregnancy (22%, 2011-2012)

21% of infants in Congo are exclusively breastfed during the first six months after birth (2011-2012)

In 2011-2012, 65% of children 6-23 months of age consumed foods rich in iron*

More than one-third (35%) of married adolescent girls expressed an unmet need for family planning (2011-2012)

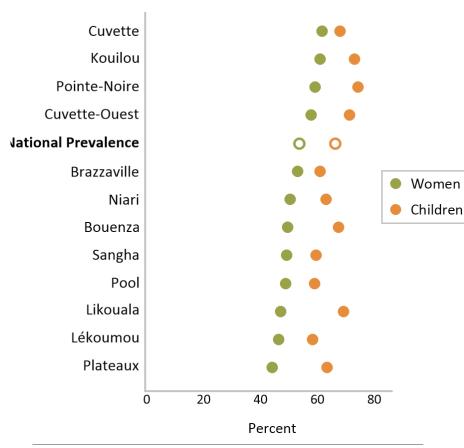

*Includes meat (including organ meat and insects), fish, poultry, and eggs

A multisectoral approach to prevent anemia will save lives and improve the wellbeing of mothers, infants, and children

Anemia has substantial negative effects on the health and economic wellbeing of nations and communities. Children with anemia experience irrevocable cognitive and developmental delays and exhibit decreased worker productivity as adults.¹ Globally, maternal anemia increases the risk of pre-term delivery and low birth weight, and iron-deficiency anemia underlies 115,000 maternal deaths and 591,000 perinatal deaths each year.²

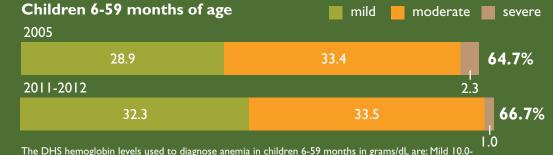

Prevalence of anemia among children 6-59 months and women 15-49 years, by department,

In Comparative Quantification of Health Risks: Global and Regional Burden of Disease Attributable to Selected Major Risk Factors. M. Ezzati, A. D. Lopez, A. Rodgers, and C. J. L. Murray, eds. Geneva: World Health Organization. Trends in the prevalence of anemia in Congo

The DHS hemoglobin levels used to diagnose anemia in children 6-39 months in grams/dL are: Mi 10.9; Moderate 7.0-9.9; Severe <7.0; Any <11.0.

Women 15-49 years of age

The DHS hemoglobin levels used to diagnose anemia in non-pregnant women 15-49 years of age in grams/dL are: Mild 10.0-11.9; Moderate 7.0-9.9; Severe <7.0; Any <12.0.

Status of Policies or Strategies to Support Reductions in Anemia*

- ☑ IFA for pregnant women
- IFA for women of reproductive age
- IFA for adolescent girls
- Iron and/or folic acid fortification legislation
- 🛛 🗵 Delayed cord clamping
- Dietary diversity for complementary feeding
- Micronutrient powders for children

- Long-lasting insecticidal nets (LLINs) for household use
- Indoor residual spraying
- □ National policy on sanitation
- IPTp for pregnant women
- Malaria diagnosis and treatment
- Deworming for children
- Deworming for pregnant women
- Breastfeeding
- no policy policy pending
- policy in place I missing documentation

*Information from the Global database on the Implementation of Nutrition Action (GINA) (https://extranet.who.int/ nutrition/gina/en) or country documentation. The status of policies and strategies have been identified to the best of our knowledge. Revisions and updates are welcome.

Evidence-informed WHO guidance can be found here: http://www.who.int/elena/en/

Anemia is a Preventable Condition—Simple Interventions Can Have a Huge Impact

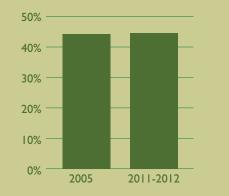

Increase iron uptake and stores

Received any IFA during pregnancy Took <60 Took 60-89 Took 90+ 0% 20% 40% 60% 80% 100%

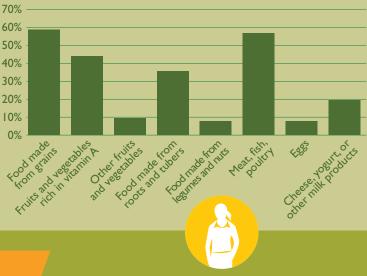

IFA supplementation among pregnant women increased

from 2005 to 2011-2012

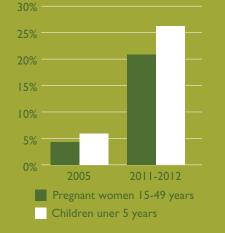

Contraception use among married women did not change from 2005 to 2011-2012

Diverse food consumption among children 6-23 months in 2011-2012 varied across food groups

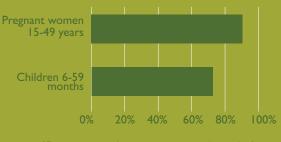

Long-lasting insecticidal net (LLIN) and insecticide treated mosquito net (ITN) use increased dramatically from 2005 to 2011-2012*

*Percentage who slept under an LLIN (2011-2012) or ITN (2005) the night before the survey

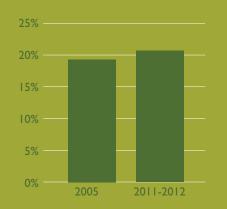

Reduce iron losses and infection

The percentage of children and women who received deworming medication in 2011-2012 was moderately high*

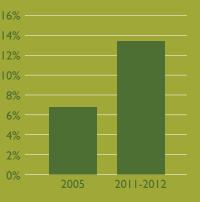

*Deworming medication given in past 6 months for children and during last pregnancy for women

Exclusive breastfeeding of children <6 months increased slightly from 2005 to 2012

The percentage of households with an improved latrine/toilet increased but remains low*

*Definition of 'improved latrine/toilet' has changed slightly across years. See Demographic and Health Surveys

Multiple Sectors Play a Role in Anemia Prevention and Treatment

Stunting and anemia share similar risk factors and are responsive to many of the same interventions

Agriculture

Increase income and reduce poverty
Production of biofortified and iron-rich crops
Small livestock/poultry
Dietary diversity

Health

- Iron supplementation

 Deworming
 Breastfeeding and
 complimentary feeding
 Family planning
 Malaria prevention
- Malaria prevention and treatment
 Delayed cord clamping

Water and Sanitation

Improved latrines
Handwashing
Access to clean water
Livestock management
Infectious disease prevention
