

In pregnancy, infections are a key cause of anemia and can be prevented by sleeping under a bednet and taking intermittent preventive treatment (IPTp) for malaria and deworming pills.

In pregnancy, anemia can be

In pregnancy, anemia can be prevented by taking iron folic acid (IFA) supplements.

For infants, young children, and mothers, delayed cord clamping, sleeping under a bednet, exclusive breastfeeding, and birth spacing reduce the risk of becoming anemic.

For young children, continued breastfeeding and adequate complementary feeding (including micronutrients), preventing and treating malaria, and taking deworming pills can prevent anemia and promote healthy growth.

In adolescence, IFA supplements and deworming pills help prevent anemia. Family planning delays the age at first birth.

In 2012-2013, 18% of pregnant women in Mali consumed 90 or more IFA tablets

20% of women receive IPTp during prenatal care to prevent malaria during pregnancy (2012-2013)

33% of infants in Mali are exclusively breastfed during the first six months after birth (2012-2013)

In 2012-2013, 49% of children 6-23 months of age consumed foods rich in iron

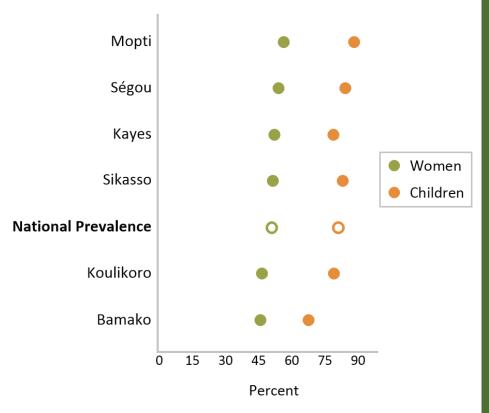

Nearly one in four (23%) of married adolescent girls expressed an unmet need for family planning (2012-2013)

*Includes meat (including organ meat), fish, poultry, and eggs

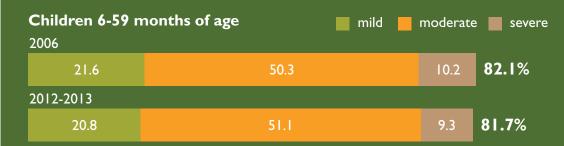

Anemia has substantial negative effects on the health and economic wellbeing of nations and communities. Children with anemia experience irrevocable cognitive and developmental delays and exhibit decreased worker productivity as adults. Globally, maternal anemia increases the risk of pre-term delivery and low birth weight, and iron-deficiency anemia underlies 115,000 maternal deaths and 591,000 perinatal deaths each year.²

Prevalence of anemia among children 6-59 months and women 15-49 years, by region

Source: Mali DHS, 2012-2013

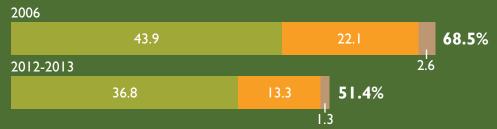

Trends in the prevalence of anemia in Mali

The DHS hemoglobin levels used to diagnose anemia in children 6-59 months in grams/dL are: Mild 10.0-10.9; Moderate 7.0-9.9; Severe <7.0; Any <11.0.

Women 15-49 years of age

The DHS hemoglobin levels used to diagnose anemia in non-pregnant women 15-49 years of age in grams/dL are: Mild 10.0-11.9; Moderate 7.0-9.9; Severe <7.0; Any <12.0.

Status of Policies or Strategies to Support Reductions in Anemia*

- ☑ IFA for pregnant women ✓ Long-lasting insecticidal nets (LLINs) for household use ■ IFA for women of reproductive age ✓ Indoor residual spraying ■ IFA for adolescent girls Mational policy on sanitation ✓ Iron and/or folic acid fortification ☑ IPTp for pregnant women legislation Malaria diagnosis and treatment ☑ Delayed cord clamping Dietary diversity for complementary ☑ Deworming for children Deworming for pregnant women Micronutrient powders for children Breastfeeding
- no policy pending
- policy in place missing documentation

*Information from the Global database on the Implementation of Nutrition Action (GINA) (https://extranet.who.int/nutrition/gina/en) or country documentation. The status of policies and strategies have been identified to the best of our knowledge. Revisions and updates are welcome.

Anemia is a Preventable Condition—Simple Interventions Can Have a Huge Impact

Increase iron uptake and stores

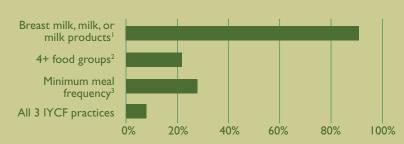

IFA supplementation among pregnant women remained relatively the same from 2006 to 2012-2013

Contraception use marginally increased among married women from 2001 to 2012-2013

Few children 6-23 months old were fed according to 3 key Infant and Young Child Feeding (IYCF) practices in 2012-2013

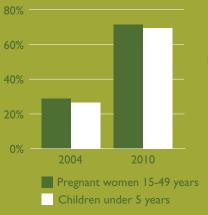

- ¹ Continued breastfeeding, or feeding of milk/milk products to non-breastfed children
- ² Feeding children solid foods, semi-solid foods, and milk products from the minimum number of food groups
- ³ Feeding children solid foods, semi-solid foods, and milk products the minimum number of times

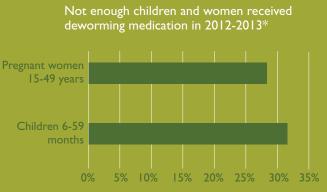

Reduce iron losses and infection

Insecticide-treated mosquito net (ITN) use increased from 2006 to 2012-2013*

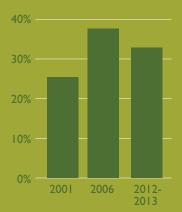

*Percentage who slept under an ITN the night before the survey

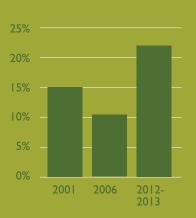

*Deworming medication given in past 6 months for children and during last pregnancy for women

Exclusive breastfeeding of children <6 months has fallen since 2006

Few households have an improved latrine/toilet*

*Definition of 'improved latrine/toilet' has changed slightly across years. See Demographic and Health Surveys.

Multiple Sectors Play a Role in Anemia Prevention and Treatment

Stunting and anemia share similar risk factors and are responsive to many of the same interventions

Agriculture

- Increase income and reduce poverty
- Production of biofortified and iron-rich crops
 - Small livestock/poultry
 - Dietary diversity

Health

- Iron supplementation
 - Deworming
- Breastfeeding and complimentary feeding
 - Family planning
- Malaria prevention and treatment
- Delayed cord clamping

Water and Sanitation

- Improved latrines
- Handwashing
- Access to clean water
- Livestock management
- Infectious disease prevention
