

In pregnancy, infections are a key cause of anemia and can be prevented by sleeping under a bednet and taking intermittent preventive treatment (IPTp) for malaria and deworming pills.

Anemia can be prevente

3cross the lifes Pa

In pregnancy, anemia can be prevented by taking iron folic acid (IFA) supplements.

In 2010-2011, only 4.9% of pregnant women in Zimbabwe consumed 90 or more IFA tablets

Not enough women are taking IPTp to prevent malaria during pregnancy (7.3%, 2010-2011)

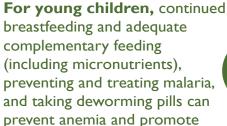

Only 32% of infants in Zimbabwe are exclusively breastfed during the first six months after birth (2010-2011)

In 2010-2011, 39% of children 6-23 months of age consumed foods rich in iron\*

15% of married adolescent girls expressed an unmet need for family planning (2010-2011)

\*Includes meat (and organ meat), fish, poultry, and eggs

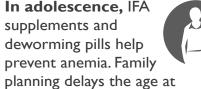

For infants, young children, and mothers, delayed cord clamping, sleeping under a bednet, exclusive breastfeeding, and birth spacing reduce the risk of becoming anemic.

healthy growth.

In adolescence, IFA supplements and deworming pills help prevent anemia. Family planning delays the age at first birth.

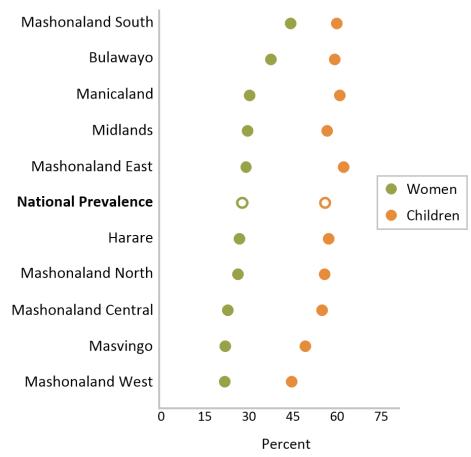

A multisectoral approach to prevent anemia will save lives and improve the wellbeing of mothers, infants, and children

Anemia has substantial negative effects on the health and economic wellbeing of nations and communities. Children with anemia experience irrevocable cognitive and developmental delays and exhibit decreased worker productivity as adults. Globally, maternal anemia increases the risk of pre-term delivery and low birth weight, and iron-deficiency anemia underlies 115,000 maternal deaths and 591,000 perinatal deaths each year.<sup>2</sup>

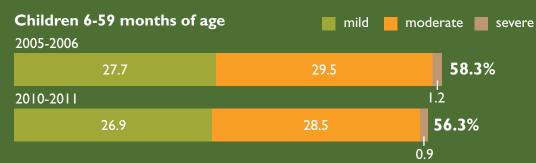

# Prevalence of anemia among children 6-59 months and women 15-49 years, by province

Source: Zimbabwe DHS, 2010-2011

I. Walker, S. P., T. D. Wachs, J. M. Gardner, B. Lozoff, G. A. Wasserman, E. Pollitt, and J. A. Carter. 2007. "Child development: risk factors for adverse outcomes in developing countries." Lancet, 369(9556): 145-157.

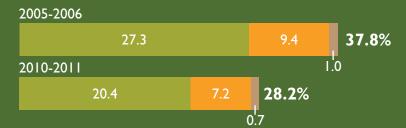

## Trends in the prevalence of anemia in Zimbabwe

The DHS hemoglobin levels used to diagnose anemia in children 6-59 months in grams/dL are: Mild 10.0-10.9; Moderate 7.0-9.9; Severe <7.0; Any <11.0.

## Women 15-49 years of age

■ no policy

The DHS hemoglobin levels used to diagnose anemia in non-pregnant women 15-49 years of age in grams/dL are: Mild 10.0-11.9; Moderate 7.0-9.9; Severe <7.0; Any <12.0.

## Status of Policies or Strategies to Support Reductions in Anemia\*

	IFA for pregnant women	Long-lasting insecticidal nets (LLINs) for household use
	IFA for women of reproductive age	✓ Indoor residual spraying
	IFA for adolescent girls	, , ,
図	Iron and/or folic acid fortification	☑ National policy on sanitation
	legislation	☑ IPTp for pregnant women
区	Delayed cord clamping	Malaria diagnosis and treatment
区		☑ Deworming for children
	feeding	■ Deworming for pregnant women
	Micronutrient powders for children	☑ Breastfeeding

## Anemia is a Preventable Condition—Simple Interventions Can Have a Huge Impact

## Increase iron uptake and stores

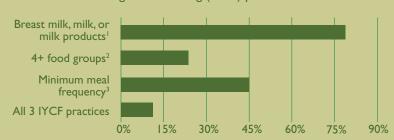

IFA supplementation among pregnant women increased from 2005-2006 to 2010-2011

Contraception use modestly increased among married women from 1999 to 2010-2011

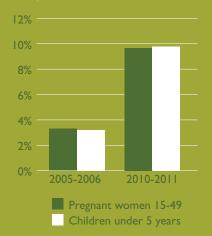

Few children 6-23 months old were fed according to 3 key Infant and Young Child Feeding (IYCF) practices in 2010-2011

- Continued breastfeeding, or feeding of milk/milk products to non-breastfed children
- <sup>2</sup> Feeding children solid foods, semi-solid foods and milk products from the minimum number of food groups
- <sup>3</sup> Feeding children solid foods, semi-solid foods and milk products the minimum number of times

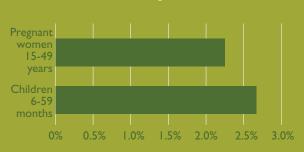

Insecticide-treated mosquito net (ITN) use tripled from 2005-2006 to 2010-2011, but remained low\*

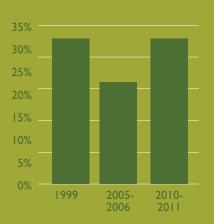

\*Percentage who slept under an ITN the night before the survey

## Reduce iron losses and infection

Not enough children and women received deworming medication in 2010\*

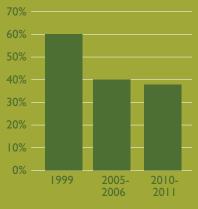

\*Deworming medication given in past 6 months for children and during last pregnancy for women Exclusive breastfeeding of children <6 months remained at 1999 levels

The percentage of households with an

improved latrine/toilet continued to fall from 1999 levels

changed slightly across years. See Demographic and Health Surveys.

## Multiple Sectors Play a Role in Anemia Prevention and Treatment

Stunting and anemia share similar risk factors and are responsive to many of the same interventions

## Agriculture

- Increase income and reduce poverty
- Production of biofortified and iron-rich crops
  - Small livestock/poultry
    - Dietary diversity

## Health

- Iron supplementation
  - Deworming
- Breastfeeding and complimentary feeding
  - Family planning
- Malaria prevention and treatment
- Delayed cord clamping

#### Water and Sanitation

- Improved latrines
  - Handwashing
- Access to clean water
- Livestock management
  - Infectious disease prevention
